

LISTING OF THE CLAIMS

1-43. (Cancelled).

44. (Currently amended) An information search provision apparatus ~~for acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result, the apparatus comprising:~~

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result;

a collection unit which collects contents, to be evaluated, posted on a web page via a network at a predetermined timing; and

a reliability control unit which increases or decreases a value, which is indicative of a degree of reliability of the contents to be evaluated, depending on whether or not it is possible for the collection unit to collect the contents to be evaluated.

45. (Previously presented) An information search provision apparatus according to Claim 44, further comprising:

an acquisition unit which acquires a search conditional statement from a user;

a search unit which searches contents matching the acquired search conditional statement; and

a reliability presenting unit which presents to the user a degree of reliability of the searched contents.

46. (Previously presented) An information search provision apparatus according to Claim 45, further comprising a prediction unit which predicts the degree of reliability of the contents to be evaluated, based on an element contributed to estimating a duration of contents contained in the contents to be evaluated,

wherein the reliability presenting unit presents the predicted reliability to the user.

47. (Previously presented) An information search provision apparatus according to Claim

44, wherein the reliability control unit gradually increases the degree of reliability of the contents to be evaluated, in a period of time during which the contents to be evaluated is acquired continuously at a predetermined timing by the collection unit.

48. (Previously presented) An information search provision apparatus according to Claim 44, further comprising a history increase range controlling unit which controls an increase range in the degree of reliability of the contents to be evaluated, according to a history on whether or not it is possible for the collection unit to collect the contents to be evaluated.

49. (Previously presented) An information search provision apparatus according to Claim 44, further comprising a relationship determining unit which determines the presence or absence of a relationship between highly reliable contents and the contents to be evaluated,

wherein the reliability control unit controls in a manner that an increase range of the contents to be evaluated when the presence of a relation is determined by the relationship determining unit is set higher than that when the absence thereof is determined.

50. (Previously presented) An information search provision apparatus according to Claim 49, wherein, based on whether or not related information indicative of the presence of a relationship between highly reliable contents and the contents to be evaluated is contained in the highly reliable contents, the relationship determining unit determines the presence or absence of a relationship between highly reliable contents and the contents to be evaluated.

51. (Currently amended) An information search provision apparatus ~~for acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result, the apparatus~~ comprising:

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result;

a collection unit which collects contents, to be evaluated, posted on a web page via a network at a predetermined timing;

a comparison unit which compares the collected contents to be evaluated with next collected contents, to be evaluated, posted on the same web page;

an update determining unit which determines if the contents to be evaluated has been updated or not, based on a result of the comparison; and

a reliability control unit which increases or decreases a value, which is indicative of a degree of reliability of the contents to be evaluated according to a result of the determination by the update determining unit.

52. (Previously presented) An information search provision apparatus according to Claim 51, wherein the reliability control unit gradually increases the degree of reliability of the contents to be evaluated, in a period of time during which it is determined continuously at a predetermined timing that the contents to be evaluated is updated by the update determining unit.

53. (Previously presented) An information search provision apparatus according to Claim 51, further comprising an update analysis unit which analyzes whether an update of the contents is intrinsically required or not,

wherein the reliability control unit increases or decreases the degree of reliability of the contents to be evaluated, according to results of the update determining unit and the update analysis unit.

54. (Currently amended) An information search provision apparatus ~~for acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result, the apparatus~~ comprising:

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result;

a related-contents acquisition unit which acquires contents related to contents to be evaluated;

an element extraction unit which extracts an element contributing to increase or decrease in a value, which is indicative of a degree of reliability of the contents to be evaluated, by referring

to the acquired contents; and

a reliability control unit which increases or decreases the value, which is indicative of the degree of reliability of the contents to be evaluated, by referring to the extracted element.

55. (Previously presented) An information search provision apparatus according to Claim 54, wherein, in terms of each aspect in evaluating the degree of reliability, the element extraction unit extracts an element contributing to increase or decrease in the degree of reliability of the contents to be evaluated, and

wherein the reliability control unit increases or decreases the degree of reliability of the contents to be evaluated, by referring to the element extracted in terms of the each aspect in evaluating the degree of reliability.

56. (Previously presented) An information search provision apparatus according to Claim 54, further comprising a classifying unit which classifies each extracted element into a first group containing elements that contribute to the increase in the degree of reliability of the contents to be evaluated or a second group containing elements that contribute to the decrease in the degree of reliability of the contents to be evaluated, and

wherein when the number of elements in the first group classified by the classifying unit is greater than that in the second group, the reliability control unit increases the degree of reliability of the contents to be evaluated.

57. (Currently amended) An information search provision apparatus ~~for acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result, the apparatus comprising:~~

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result;

a contents acquisition unit which acquires contents containing an item to be assessed;

a contents specifying unit which specifies own contents serving as an information source of the item to be assessed;

a consistency determining unit which determines consistency of the item to be assessed in a manner that the specified own contents is compared with contents, in the acquired contents, other than the own contents; and

a reliability control unit which increases or decreases a value, which is indicative of a degree of reliability of the own contents, and a value, which is indicative of a degree of reliability of the other contents, according to the decision made by the consistency determining unit.

58. (Previously presented) An information search provision apparatus according to Claim 57, wherein when both the degree of reliability of the own contents and the degree of reliability of the other contents are high and the presence of consistency of the item to be assessed is determined by the consistency determining unit, the reliability control unit increases both the degree of reliability of the own contents and the degree of reliability of the other contents.

59. (Previously presented) An information search provision apparatus according to Claim 44, further comprising:

an access unit which accesses a server by referring to location information indicative of a location of the server open to the public through a web page;

an access determining unit which determines if an access of the access unit to the server is allowed or not;

an access history storage which stores correspondence between a decision result by the access determining unit and timing at which the access unit has accessed the server; and

a timing specifying unit which specifies timing at which the access of the access unit to the server was first successful, by referring to the correspondence,

wherein the reliability control unit starts performing a control of increasing or decreasing the degree of reliability at the specified timing.

60. (Previously presented) An information search provision apparatus according to Claim 51, further comprising:

an access unit which accesses a server by referring to location information indicative of a location of the server open to the public through a web page;

an access determining unit which determines if an access of the access unit to the server is allowed or not;

an access history storage which stores correspondence between a decision result by the access determining unit and timing at which the access unit has accessed the server; and

a timing specifying unit which specifies timing at which the access of the access unit to the server was first successful, by referring to the correspondence,

wherein the reliability control unit starts performing a control of increasing or decreasing the degree of reliability at the specified timing.

61. (Previously presented) An information search provision apparatus according to Claim 54, further comprising:

an access unit which accesses a server by referring to location information indicative of a location of the server open to the public through a web page;

an access determining unit which determines if an access of the access unit to the server is allowed or not;

an access history storage which stores correspondence between a decision result by the access determining unit and timing at which the access unit has accessed the server; and

a timing specifying unit which specifies timing at which the access of the access unit to the server was first successful, by referring to the correspondence,

wherein the reliability control unit starts performing a control of increasing or decreasing the degree of reliability at the specified timing.

62. (Previously presented) An information search provision apparatus according to Claim 57, further comprising:

an access unit which accesses a server by referring to location information indicative of a location of the server open to the public through a web page;

an access determining unit which determines if an access of the access unit to the server is allowed or not;

an access history storage which stores correspondence between a decision result by the access determining unit and timing at which the access unit has accessed the server; and

a timing specifying unit which specifies timing at which the access of the access unit to the server was first successful, by referring to the correspondence,

wherein the reliability control unit starts performing a control of increasing or decreasing the degree of reliability at the specified timing.

63. (Currently amended) An information search provision system including a terminal apparatus connected on a network, a server for providing a web page via the network and an information search provision apparatus ~~for collecting contents posted on a web page on the server and providing contents, matching a search conditional statement, among the collected contents as a search result to the terminal apparatus, the information search provision apparatus comprising:~~

a collection unit which collects contents, to be evaluated, posted on a web page via the network at a predetermined timing;

at least one processing unit that operates to perform at least the steps of providing contents, matching a search conditional statement, among the collected contents as a search result to the terminal apparatus; and

a reliability control unit which increases or decreases a value, which is indicative of a degree of reliability of the contents to be evaluated, depending on whether it is possible to collect the contents to be evaluated.

64. (Currently amended) An information search provision system, comprising:

a contents providing apparatus which posts contents to be evaluated, on a web page;

a terminal apparatus which accesses the contents to be evaluated, via a network; and

an information search provision apparatus ~~which acquires a search conditional statement and provides contents, matching the search conditional statement, as a search result,~~

wherein the terminal apparatus includes an information transmitting unit which transmits client information associated with the terminal apparatus, and

wherein the information search provision apparatus includes:

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result;

an information receiver which receives directly or indirectly client information transmitted from the terminal apparatus that has accessed via the network the contents to be evaluated; and

a reliability varying unit which increases or decreases a value, which is indicative of a degree of reliability of the contents to be evaluated, based on the client information.

65. (Previously presented) An information search provision system according to Claim 64, wherein the information transmitting unit transmits, as the client information, information related to access to the contents to be evaluated, and

wherein the reliability varying unit increases or decreases the degree of reliability of the contents to be evaluated, according to a status of access from the terminal apparatus to the contents to be evaluated.

66. (Previously presented) An information search provision system according to Claim 64, wherein the information transmitting unit transmits, as the client information, information transferred from the terminal apparatus to the contents to be evaluated, and

wherein the reliability varying unit increases or decreases the degree of reliability of the contents to be evaluated, according to the information transferred from the terminal apparatus to the contents to be evaluated.

67. (Previously presented) An information search provision system according to Claim 64, wherein when the terminal apparatus has accessed the contents to be evaluated, the contents providing apparatus transmits information on access from the terminal apparatus to the contents to be evaluated and/or information transferred from the terminal apparatus to the contents to be evaluated, from the terminal apparatus to the information search provision apparatus.

68. (Currently amended) An information search provision apparatus ~~for acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result, the apparatus including:~~

at least one processing unit that operates to perform at least the steps of acquiring a

search conditional statement and providing contents, matching the search conditional statement, as a search result;

an information receiver which receives directly or indirectly client information transmitted from a terminal apparatus that has accessed the contents to be evaluated; and

a reliability varying unit which increases or decreases a value, which is indicative of a degree of reliability of the contents to be evaluated, based on the client information.

69. (Previously presented) An information search provision apparatus according to Claim 68, wherein the information receiver receives, as the client information, information on a status of access from the terminal apparatus to the contents to be evaluated, and

wherein the reliability varying unit increases or decreases the degree of reliability of the contents to be evaluated, according to the access status.

70. (Previously presented) An information search provision apparatus according to Claim 68, wherein the information receiver receives, as the client information, information transferred from the terminal apparatus to the contents to be evaluated, and

wherein the reliability varying unit increases or decreases the degree of reliability of the contents to be evaluated, according to the information transferred from the terminal apparatus to the contents to be evaluated.

71. (Currently amended) An information search provision system, comprising:

a contents providing apparatus which posts contents to be evaluated, on a web page;

a terminal apparatus which accesses the contents to be evaluated, via a network; and

an information search provision apparatus ~~which acquires a search conditional statement and provides contents, matching the search conditional statement, as a search result,~~

wherein the terminal apparatus includes an information transmitting unit which transmits client information associated with the terminal apparatus, and

wherein the information search provision apparatus includes:

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement,

as a search result;

an information receiver which receives directly or indirectly client information transmitted from the terminal apparatus that has accessed via the network the contents to be evaluated; and

an asset value varying unit which increases or decreases an asset value ~~estimated~~ for the contents to be evaluated, based on the client information.

72. (Previously presented) An information search provision system according to Claim 71, wherein the information transmitting unit transmits, as the client information, information related to access to the contents to be evaluated, and

wherein the asset value varying unit increases or decreases the asset value according to a status of access from the terminal apparatus to the contents to be evaluated.

73. (Previously presented) An information search provision system according to Claim 71, wherein the information transmitting unit transmits, as the client information, information transferred from the terminal apparatus to the contents to be evaluated, and

wherein the asset value varying unit increases or decreases the asset value according to the information transferred from the terminal apparatus to the contents to be evaluated.

74. (Previously presented) An information search provision system according to Claim 71, wherein when the terminal apparatus has accessed the contents to be evaluated, the contents providing apparatus transmits information on access from the terminal apparatus to the contents to be evaluated and/or information transferred from the terminal apparatus to the contents to be evaluated, from the terminal apparatus to the information search provision apparatus.

75. (Currently amended) An information search provision apparatus ~~for acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result, the apparatus~~ including:

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement,

as a search result:

an information receiver which receives directly or indirectly client information transmitted from a terminal apparatus that has accessed the contents to be evaluated; and

an asset value varying unit which increases or decreases an asset value ~~estimated~~ for the contents to be evaluated, based on the client information.

76. (Previously presented) An information search provision apparatus according to Claim 75, wherein the information receiver receives, as the client information, information on a status of access from the terminal apparatus to the contents to be evaluated, and

wherein the asset value varying unit increases or decreases the asset value according to the status of access from the terminal apparatus to the contents to be evaluated.

77. (Previously presented) An information search provision apparatus according to Claim 75, wherein the information receiver receives, as the client information, information transferred from the terminal apparatus to the contents to be evaluated, and

wherein the asset value varying unit increases or decreases the asset value according to the information transferred from the terminal apparatus to the contents to be evaluated.

78. (Currently amended) An information search provision apparatus ~~for acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result, the apparatus~~ comprising:

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result;

a collection unit which collects contents to be evaluated and contents, other than said evaluating contents, for use in comparison both posted on a web page via a network at a predetermined timing;

an update determining unit which acquires respectively publication circumstances of a decision item involving a provider of the contents to be evaluated, about the contents to be evaluated and the comparing contents and determines if the contents to be evaluated is properly

updated, by comparing the publication circumstance of a decision item in the contents to be evaluated with that in the comparing contents; and

a reliability control unit which increases or decreases a value, which is indicative of a degree of reliability of the contents to be evaluated, according to a result obtained from the update determining unit.

79. (Previously presented) An information search provision apparatus according to Claim 78, wherein when the decision item has not been posted in the contents to be evaluated at the publication of the decision item in the comparing contents, the update determining unit determines that the contents to be evaluated is not properly updated.

80. (Previously presented) An information search provision apparatus according to Claim 78, wherein when the decision item was posted in the comparing contents after the decision item was posted in the contents to be evaluated, the update determining unit determines that the contents to be evaluated is properly updated.

81. (Currently amended) An information search provision apparatus ~~for acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result, the apparatus~~ comprising:

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result;

a collection unit which collects contents to be evaluated posted on a web page via a network at a predetermined timing;

an identity determining unit which determines the identity of the contents, to be evaluated, collected at different timings; and

a reliability control unit which increases or decreases a value, which is indicative of a degree of reliability of the contents to be evaluated, according to a result obtained from the identity determining unit.

82. (Previously presented) An information search provision apparatus according to Claim 81, wherein the identity determining unit determines whether or not the contents to be evaluated collected at early timing is identical to part of the contents to be evaluated at subsequent timing, and

wherein when it is determined that the contents to be evaluated collected at early timing is identical to part of the contents to be evaluated at subsequent timing, the reliability control unit increases the degree of reliability of the contents to be evaluated.

83. (Currently amended) An information search provision apparatus ~~for acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result, the apparatus comprising:~~

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result;

a collection unit which collects contents to be evaluated and contents, other than said evaluating contents, for use in comparison both posted on a web page via a network at a predetermined timing;

a uniqueness determining unit which compares the contents to be evaluated with the comparing contents which had already been collected at the time of collection of the contents to be evaluated and determines uniqueness of the contents to be evaluated; and

a reliability control unit which increases or decreases a value, which is indicative of a degree of reliability of the contents to be evaluated, according to a result obtained from the uniqueness determining unit.

84. (Previously presented) An information search provision apparatus according to Claim 83, wherein when the contents to be evaluated is contents such that the comparing contents which had already been collected at the time of collection of the contents to be evaluated is altered, the uniqueness determining unit determines that the contents to be evaluated is not unique, and

wherein the reliability control unit decreases the degree of reliability of the contents, to be evaluated, which was determined to be contents such that the comparing contents is altered.

85. (Previously presented) An information search provision apparatus according to Claim 44, further comprising:

- a specifying unit which specifies location information indicative of a location of the contents to be evaluated; and

- a reliability transform unit which transforms the degree of reliability, of the contents to be evaluated, increased or decreased by the reliability control unit into a degree of reliability of the location information.

86. (Previously presented) An information search provision apparatus according to Claim 51, further comprising:

- a specifying unit which specifies location information indicative of a location of the contents to be evaluated; and

- a reliability transform unit which transforms the degree of reliability, of the contents to be evaluated, increased or decreased by the reliability control unit into a degree of reliability of the location information.

87. (Previously presented) An information search provision apparatus according to Claim 54, further comprising:

- a specifying unit which specifies location information indicative of a location of the contents to be evaluated; and

- a reliability transform unit which transforms the degree of reliability, of the contents to be evaluated, increased or decreased by the reliability control unit into a degree of reliability of the location information.

88. (Previously presented) An information search provision apparatus according to Claim 57, further comprising:

- a specifying unit which specifies location information indicative of a location of the contents to be evaluated; and

- a reliability transform unit which transforms the degree of reliability, of the contents to be

evaluated, increased or decreased by the reliability control unit into a degree of reliability of the location information.

89. (Previously presented) An information search provision apparatus according to Claim 68, further comprising:

- a specifying unit which specifies location information indicative of a location of the contents to be evaluated; and

- a reliability transform unit which transforms the degree of reliability, of the contents to be evaluated, increased or decreased by the reliability control unit into a degree of reliability of the location information.

90. (Previously presented) An information search provision apparatus according to Claim 78, further comprising:

- a specifying unit which specifies location information indicative of a location of the contents to be evaluated; and

- a reliability transform unit which transforms the degree of reliability, of the contents to be evaluated, increased or decreased by the reliability control unit into a degree of reliability of the location information.

91. (Previously presented) An information search provision apparatus according to Claim 81, further comprising:

- a specifying unit which specifies location information indicative of a location of the contents to be evaluated; and

- a reliability transform unit which transforms the degree of reliability, of the contents to be evaluated, increased or decreased by the reliability control unit into a degree of reliability of the location information.

92. (Previously presented) An information search provision apparatus according to Claim 83, further comprising:

- a specifying unit which specifies location information indicative of a location of the

contents to be evaluated; and

a reliability transform unit which transforms the degree of reliability, of the contents to be evaluated, increased or decreased by the reliability control unit into a degree of reliability of the location information.

93. (Previously presented) An information search provision apparatus according to Claim 85, further comprising:

a location information classifying unit which classifies the location information into a plurality of groups each of which belongs to a common attribute; and

a location information group reliability calculating unit which calculates a degree of reliability of location information for each of the plurality of classified groups.

94. (Previously presented) An information search provision apparatus according to Claim 86, further comprising:

a location information classifying unit which classifies the location information into a plurality of groups each of which belongs to a common attribute; and

a location information group reliability calculating unit which calculates a degree of reliability of location information for each of the plurality of classified groups.

95. (Previously presented) An information search provision apparatus according to Claim 87, further comprising:

a location information classifying unit which classifies the location information into a plurality of groups each of which belongs to a common attribute; and

a location information group reliability calculating unit which calculates a degree of reliability of location information for each of the plurality of classified groups.

96. (Previously presented) An information search provision apparatus according to Claim 88, further comprising:

a location information classifying unit which classifies the location information into a plurality of groups each of which belongs to a common attribute; and

a location information group reliability calculating unit which calculates a degree of reliability of location information for each of the plurality of classified groups.

97. (Previously presented) An information search provision apparatus according to Claim 89, further comprising:

a location information classifying unit which classifies the location information into a plurality of groups each of which belongs to a common attribute; and

a location information group reliability calculating unit which calculates a degree of reliability of location information for each of the plurality of classified groups.

98. (Previously presented) An information search provision apparatus according to Claim 90, further comprising:

a location information classifying unit which classifies the location information into a plurality of groups each of which belongs to a common attribute; and

a location information group reliability calculating unit which calculates a degree of reliability of location information for each of the plurality of classified groups.

99. (Previously presented) An information search provision apparatus according to Claim 91, further comprising:

a location information classifying unit which classifies the location information into a plurality of groups each of which belongs to a common attribute; and

a location information group reliability calculating unit which calculates a degree of reliability of location information for each of the plurality of classified groups.

100. (Previously presented) An information search provision apparatus according to Claim 92, further comprising:

a location information classifying unit which classifies the location information into a plurality of groups each of which belongs to a common attribute; and

a location information group reliability calculating unit which calculates a degree of reliability of location information for each of the plurality of classified groups.

101. (Previously presented) An information search provision apparatus according to Claim 85, wherein the specifying unit specifies a domain name as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the domain name.

102. (Previously presented) An information search provision apparatus according to Claim 86, wherein the specifying unit specifies a domain name as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the domain name.

103. (Previously presented) An information search provision apparatus according to Claim 87, wherein the specifying unit specifies a domain name as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the domain name.

104. (Previously presented) An information search provision apparatus according to Claim 88, wherein the specifying unit specifies a domain name as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the domain name.

105. (Previously presented) An information search provision apparatus according to Claim 89, wherein the specifying unit specifies a domain name as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the domain name.

106. (Previously presented) An information search provision apparatus according to Claim 90, wherein the specifying unit specifies a domain name as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the domain name.

107. (Previously presented) An information search provision apparatus according to Claim 91, wherein the specifying unit specifies a domain name as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the domain name.

108. (Previously presented) An information search provision apparatus according to Claim 92, wherein the specifying unit specifies a domain name as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the domain name.

109. (Previously presented) An information search provision apparatus according to Claim 85, wherein the specifying unit specifies an IP address as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the IP address.

110. (Previously presented) An information search provision apparatus according to Claim 86, wherein the specifying unit specifies an IP address as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the IP address.

111. (Previously presented) An information search provision apparatus according to Claim 87, wherein the specifying unit specifies an IP address as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the IP address.

112. (Previously presented) An information search provision apparatus according to Claim 88, wherein the specifying unit specifies an IP address as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the IP address.

113. (Previously presented) An information search provision apparatus according to Claim 89, wherein the specifying unit specifies an IP address as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the IP address.

114. (Previously presented) An information search provision apparatus according to Claim 90, wherein the specifying unit specifies an IP address as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the IP address.

115. (Previously presented) An information search provision apparatus according to Claim 91, wherein the specifying unit specifies an IP address as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the IP address.

116. (Previously presented) An information search provision apparatus according to Claim 92, wherein the specifying unit specifies an IP address as the location information, and wherein the reliability transform unit transforms the degree of reliability of the contents to be evaluated into a degree of reliability of the IP address.

117. (Previously presented) An information search provision apparatus according to Claim 85, wherein the reliability transform unit calculates a degree of reliability of an electronic mail address including the location information, based on the obtained degree of reliability of the location information.

118. (Previously presented) An information search provision apparatus according to Claim 86, wherein the reliability transform unit calculates a degree of reliability of an electronic mail address including the location information, based on the obtained degree of reliability of the location information.

119. (Previously presented) An information search provision apparatus according to Claim 87, wherein the reliability transform unit calculates a degree of reliability of an electronic mail address including the location information, based on the obtained degree of reliability of the location information.

120. (Previously presented) An information search provision apparatus according to Claim 88, wherein the reliability transform unit calculates a degree of reliability of an electronic mail address including the location information, based on the obtained degree of reliability of the location information.

121. (Previously presented) An information search provision apparatus according to Claim 89, wherein the reliability transform unit calculates a degree of reliability of an electronic mail address including the location information, based on the obtained degree of reliability of the location information.

122. (Previously presented) An information search provision apparatus according to Claim 90, wherein the reliability transform unit calculates a degree of reliability of an electronic mail address including the location information, based on the obtained degree of reliability of the location information.

123. (Previously presented) An information search provision apparatus according to Claim 91, wherein the reliability transform unit calculates a degree of reliability of an electronic mail address including the location information, based on the obtained degree of reliability of the location information.

124. (Previously presented) An information search provision apparatus according to Claim 92, wherein the reliability transform unit calculates a degree of reliability of an electronic mail address including the location information, based on the obtained degree of reliability of the location information.

125. (New) The information search provision system according to Claim 71, wherein the asset value is calculated as a function for a profit over a specific period, customer frequency of use during a specific period, and/or estimated profit.

126. (New) The information search provision apparatus according to Claim 75, wherein the asset value is calculated as a function for a profit over a specific period, customer frequency of use during a specific period, and/or estimated profit.

127. (New) An information search provision system, comprising:
a contents providing apparatus which posts contents to be evaluated, on a web page;
a terminal apparatus which accesses the contents to be evaluated, via a network; and
an information search provision apparatus, wherein:
the terminal apparatus includes an information transmitting unit which transmits client information associated with the terminal apparatus, and
the information search provision apparatus includes:
at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result;
an information receiver which receives directly or indirectly client information transmitted from the terminal apparatus that has accessed via the network the contents to be evaluated; and
an asset value calculating unit which calculates a profit in a transaction related to the contents, and calculates an asset value by use of the profit.

128. (New) The information search provision system according to Claim 127, wherein:
the asset value calculating unit calculates the asset value by considering at least one of: a figure of the profit totaled during a certain period, the frequency of use of regular customers, a property of a product, and by estimating a future profit.

129. (New) An information search provision apparatus including:

at least one processing unit that operates to perform at least the steps of acquiring a search conditional statement and providing contents, matching the search conditional statement, as a search result;

an information receiver which receives directly or indirectly client information transmitted from a terminal apparatus that has accessed the contents to be evaluated; and

an asset value calculating unit which calculates a profit in a transaction related to the contents, and calculates an asset value by use of the profit.

130. (New) The information search provision system according to Claim 129, wherein:

the asset value calculating unit calculates the asset value by considering at least one of: a figure of the profit totaled during a certain period, the frequency of use of regular customers, a property of a product, and by estimating a future profit.
